EDUCATION

California Polytechnic State University, San Luis Obispo

B.S. Mechanical Engineering, '25 - Concentration: Manufacturing

Relevant Course Work: SolidWorks & Detailed Design, Mechanical System Design, Vibrations, Fluid Dynamics, Thermodynamics, Heat Transfer, Thermal System Design, Computer-Aided Manufacturing, Manufacturing Processes and Tooling, CNC Programming

RELEVANT WORK EXPERIENCE

Empirical Systems Aerospace

Associate Mechanical Engineer (January 2026 - Current)

- Own (start-to-finish) mechanical subsystem design for one-way attack UAS, including propulsion, fuel management, control surface actuation, wing deployment mechanisms, vehicle dynamics, and composite structures; integrate and design around applicable MIL-STDs for compatibility with existing military hardware.
- Lumberjack Program:
 - Led mechanical design, test, and integration of a drogue-chute recoverability system; first successful chute recovery for a belly-skid vehicle in company history, new company IP.
 - Owned technical scope end-to-end: vendor sourcing under NDA, sizing analysis, procurement, and testing; presented design across 3+ design reviews to Mission Assurance, Chief Engineers, and client technical leadership - all approved.
 - Own BRU/captive-carry and improved control surface integration for a new vehicle configuration; first-ever implementations of both within the company, critical to enabling vehicle range and mission capability.
 - Own propulsion integration end-to-end: mounting design, load analysis, material selection, and structural sizing; translating engine loads into the airframe interface.
- [Classified] Program:
 - Selected 3 weeks into the role for Build Manager position; sole liaison between build engineers and Mechanical Design, resolving engineering blockers in real time to keep production on schedule.
 - Designed the 45+ LRIP vehicle work-cell layout, assembly, and Kanban system that structured the program's full-rate build.
 - Directly responsible for delivering the first 4 flight vehicles on time for testing, enabling the program's first flight, first mission flights, and first target hit.

Wallace Group Engineering

Associate Mechanical Engineer (July 2025 – Jan 2026) / *Mechanical Engineering Intern* (July 2024 – July 2025)

- Designed and analyzed pump and piping systems across 17 projects for wineries and wastewater treatment plants, sizing for flow rates from 50–150 GPM and varying elevation/pressure differentials.
- Authored 15 technical reports translating field data and client requirements into implementable mechanical designs.
- Led design of a 5-header wastewater overflow system routing to a leachfield for a casino client, coordinating directly with subcontractors on implementation.
- Progressed from supporting senior engineers on pump analysis to independently owning system design across full project lifecycle.

SKILLS & PROGRAMS

Transferrable Skills

- Cross-functional communicator - I build direct working relationships with machinists and technicians to close the design-to-build gap
- Execution-first under tight timelines - Rapid hardware development from concept to flight-proven article
- Engineering drawing creation, review, and revision control; GD&T per ASME Y14.5 on select drawings
- 200+ hrs. in Cal Poly Machine Shops on personal/non-academic projects
- Design for Manufacturability (DFM)

Programs

- CAD: SolidWorks, AutoCAD
- PDM: SolidWorks PDM
- CNC: MasterCam, HSMWork
- Coding: MATLAB, Python, G-Code
- Microsoft: Word, Excel, Outlook
